### HLK 3100 High Pressure Water Jet

These two jet types both have water flows of 9 litres per min at 120 Bar. They are driven from a 2.2 Kwatt motor, which, on full load, draws typically 6Amps at 415Volts. The two nozzles have 1mm dia. holes, the top one has an orbiting head which creates the appearance of a fine spray, yet in fact is a constantly moving fine jet, and the lower is a straight jet nozzle.

Their principal use is for cleaning prior to inspection
